

Lab Assignment #5

Math 437 - Modern Data Analysis

Due March 8, 2023

Instructions

The purpose of this lab is to introduce more advanced regression strategies that were probably not covered in Math 338.

In this lab, we will be working with four datasets. Three (**Boston**, **Carseats**, and **Wage**) are contained in the ISLR2 package. Information about these datasets can be found by searching R help for them.

The fourth dataset, **RateMyProfessor**, needs to be downloaded from Canvas. This dataset contains the overall average rating from <https://www.ratemyprofessors.com/> for over 22,000 professors, as collected by Murray et al. (2020). A data dictionary for the dataset can be found at https://github.com/murrayds/aa_rmp/tree/master/data (note that I removed a bunch of variables so that you're downloading a 2 MB dataset instead of a much larger one).

```
library(ISLR2)
library(ggplot2)
library(dplyr)
library(broom) # See Problem 3b

RateMyProfessor <- read.csv("RateMyProfessor.csv")
```

This lab assignment is worth a total of **15 points**.

Problem 1: Indicator Variables

Part b (Explanation: 1 pt)

Interpret the slope estimate corresponding to `ShelveLocGood` in the model fit in part (a).

If `ShelveLocGood` = 1, that is, if the shelving location is good, then `Sales` (child car seat sales) increases by 4.84.

Part c (Code: 1 pt; Explanation: 1.5 pts)

Using the `RateMyProfessor` dataset, fit a linear model predicting the overall rating of a professor (`overall`) from the difficulty rating (`difficulty`), chili pepper rating (`hotness`), and rank (`rank`). What are the reference levels for each categorical variable? How do you know?

The reference level for `difficulty` is 1.000000. The reference level for `hotness` is cold. The reference level for `rank` is “Assistant Professor.” By default, R sets the reference level to the first category in alpha-numeric order. For categories that use letters/words, the reference level is set to whatever category comes first in alphabetical order. For categories that use numbers, the reference level is set to whatever number comes first in numerical order.

```

The instructor predicted to have the highest overall rating is an attractive assistant professor, and the instructor predicted to have the lowest overall rating is a less-attractive professor. Professors who are better looking and or have better personalities are more attractive in students' eyes, which is why they have higher ratings than professors with less attraction. I believe assistant professors have higher ratings than professors because full-time professors have other things they need to do, such as conducting research, writing papers, or advising, while assistant professors spend more time with the students.

Problem 2: Interaction Terms

```

Part b (Explanation: 2 pts)

Notice that **age** is a significant predictor of **medv** in the model without the interaction term (from ISLR Lab 3.6.3 on Lab 4), but it is no longer a significant predictor of **medv** once we add in the interaction term. The p-value is huge (0.971!). What do you think is happening here? Are we okay to remove the **age** variable from the model with the interaction term? Why or why not?

The p-value increased drastically because in the new model, **age** is mostly affected by the interaction effect and not the main effect. In this lab, we also have the factor of `lstat:age` which resulted in such a big p-value. In the previous lab, we had `lstat` and `age` separately, with just the slopes in the least-squares regression line. We are not okay to remove the **age** variable from the model with the interaction term because there may be some correlation between the interaction and main effects. We shouldn't make a decision to remove a variable based on statistical significance.

Part c (Code: 1 pt; Explanation: 1.5 pts)

Create a new dataset, `associates`, by filtering the `RateMyProfessor` dataset to include only the Associate Professors.

```
associates <- filter(RateMyProfessor, rank == "Associate Professor")
associates
```

Next, complete this code chunk to create a graph of overall rating vs. difficulty rating for the associate professors, with “hot” professors shown in red and “cold” professors shown in blue. Remember to delete `eval = FALSE` once you get the code to run!

```
ggplot(RateMyProfessor, aes(x=difficulty, y=overall, color=hotness)) + # add appropriate arguments here
  geom_point(alpha = 0.25) +
  # if you added arguments to geom_point, add the same arguments to geom_smooth
  # otherwise don't touch these lines - they will run fine
  geom_smooth(method = "lm", se = FALSE) + # regression line, no confidence bands
  scale_color_manual(name = "Chili Pepper Rating", # make legend nice
    labels = c(hot = "Attractive", cold = "Less-attractive"),
    values = c(hot = "red", cold = "blue"))
```

```
## `geom_smooth()` using formula = 'y ~ x'
```

How does the difficulty of the professor modify the relationship between attractiveness and overall rating?

Part d (Code: 1 pt; Computation and Explanation: 2 pts)

Using the `RateMyProfessor` dataset, fit a linear model predicting overall rating from the difficulty rating (`difficulty`), chili pepper rating (`hotness`), rank (`rank`), and an interaction term between `difficulty` and `hotness`.

```
lm(overall ~ difficulty + hotness + rank + difficulty:hotness, data = RateMyProfessor)
```

```
##
## Call:
## lm(formula = overall ~ difficulty + hotness + rank + difficulty:hotness,
##     data = RateMyProfessor)
##
## Coefficients:
##             (Intercept)              difficulty              hotnesshot
##                   5.47087                 -0.64087                 -0.25238
## rankAssociate Professor      rankProfessor  difficulty:hotnesshot
##                   -0.04894                 -0.04428                  0.29706
```

Using your results, write out the least-squares regression equation predicting overall rating from difficulty for an attractive associate professor. Also, write out the least-squares regression equation predicting overall rating from difficulty for a less-attractive associate professor. Explain how you obtained each equation.

In general, the least-squares regression equation is: $\text{overall} = 5.47087 + (-0.64087)(\text{difficulty}) + (-0.25238)(\text{hotness}=\text{hot}) + (-0.04894)(\text{rank}=\text{Associate Professor}) + (-0.04428)(\text{rank}=\text{Professor}) + (0.29706)(\text{difficulty})(\text{hotness}=\text{hot})$

*attractive associate professor

$\text{overall} = 5.47087 + (-0.64087)(\text{difficulty}) + (-0.25238)(1) + (-0.04894)(1) + (-0.04428)(0) + (0.29706)(\text{difficulty})(1)$

$\text{overall} = 5.16955 + (-0.34381)(\text{difficulty})$

For an attractive associate professor, $\text{hotness}=\text{hot}=1$, $\text{rank}=\text{Associate Professor}=1$, $\text{rank}=\text{Professor}=0$. Then we add like terms to get the equation.

- less-attractive associate professor

$\text{overall} = 5.47087 + (-0.64087)(\text{difficulty}) + (-0.25238)(0) + (-0.04894)(1) + (-0.04428)(0) + 0.29706(\text{difficulty})(0)$

$\text{overall} = 5.42193 + (-0.64087)(\text{difficulty})$

For a less-attractive associate professor, $\text{hotness}=\text{hot}=0$, $\text{rank}=\text{Associate Professor}=1$, $\text{rank}=\text{Professor}=0$. Then we add like terms to get the equation.

Do your equations support your conclusions from part (c)? Explain why or why not.

Based on the equations from part (c), we see that an attractive associate professor's overall rating decreases at a lower rate than a less-attractive associate professor's overall rating as difficulty increases.

Part b (Code: 1 pt)

In the code chunk below, create a data frame with a single variable, **age**, ranging from 18 to 80, then use the **augment** function (in the **broom** package) to obtain the predicted wage, standard error of the mean wage, and the lower and upper bounds of a 95% confidence interval for the population mean wage at each age. (You can use any of **fit**, **fit2**, **fit2a**, or **fit2b** - they should all give the same predictions.)

What is the 95% confidence interval for the population mean wage of 25-year-olds? 50-year-olds?

We estimate with 95% confidence that the population mean wage for 25-year-olds is in the interval from 85.21437 to 91.73322. We estimate with 95% confidence that the population mean wage for 50-year-olds is in the interval from 117.3538 to 121.7865.

```
data.frame(age)
```
